Chitkara University, Punjab**

- Uses Artificial Intelligence and NLP to detect important moments in meetings automatically.
- Identifies key discussions, decisions, and action items from meeting audio or transcripts.
- Generates highlights and summaries to save time and improve productivity and communication.
- Reduces manual note-taking effort and helps users quickly review meetings.
- Can be used in corporate meetings, online classes, interviews, and virtual conferences.

Background

In today's digital world, meetings are conducted frequently in organizations, colleges, and online platforms. Managing long meeting recordings and identifying important discussions manually is time-consuming. AI-Based Meeting Moment Detection is developed to solve this problem using Artificial Intelligence and Natural Language Processing. The system automatically detects key moments such as decisions, action items, and important conversations, making meetings more organized, efficient, and easy to review.

Objective

- To develop an AI-based system for detecting important moments in meetings automatically.
- To identify key discussions, decisions, and action items from meeting conversations.
- To reduce manual note-taking and save users' time during meeting reviews.
- To generate meeting highlights and summaries for better productivity and communication.
- To improve meeting management using Artificial Intelligence and Natural Language Processing (NLP).

Significance

- Helps users quickly identify important meeting moments without watching full recordings.
- Saves time and reduces manual effort in note-taking and meeting analysis.
- Improves productivity, communication, and decision tracking in organizations.
- Provides accurate meeting summaries and highlights using AI and NLP techniques.
- Useful for corporate meetings, online classes, interviews, and virtual conferences.

In many organizations and online platforms, meetings are lengthy and contain large amounts of information, making it difficult to identify important discussions, decisions, and action items manually. Traditional note-taking methods are time-consuming and may miss critical details. Therefore, there is a need for an AI-based system that can automatically detect important meeting moments and generate accurate highlights and summaries efficiently

KEY FEATURES

- Automatic detection of important meeting moments.
- Speech-to-text conversion for meeting audio processing.
- Identification of key decisions and action items.
- AI and NLP-based meeting analysis.
- Automatic generation of meeting highlights and summaries.
- Timestamp-based moment tracking for quick review.

AI-Based Meeting Moment Detection is an efficient system that helps users identify important discussions, decisions, and action items automatically. By using Artificial Intelligence and NLP, the project reduces manual effort, saves time, and improves meeting productivity. The system provides accurate highlights and summaries, making meeting management easier and more effective for organizations, educational institutions, and online communication platforms.

It also helps users quickly review lengthy meetings without listening to the complete recording. The project enhances communication, improves decision tracking, and increases overall efficiency. In the future, the system can be enhanced with multilingual support, emotion detection, and real-time meeting analysis features.
